                2.05                    0.10                   0.01
```

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

(skip)

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

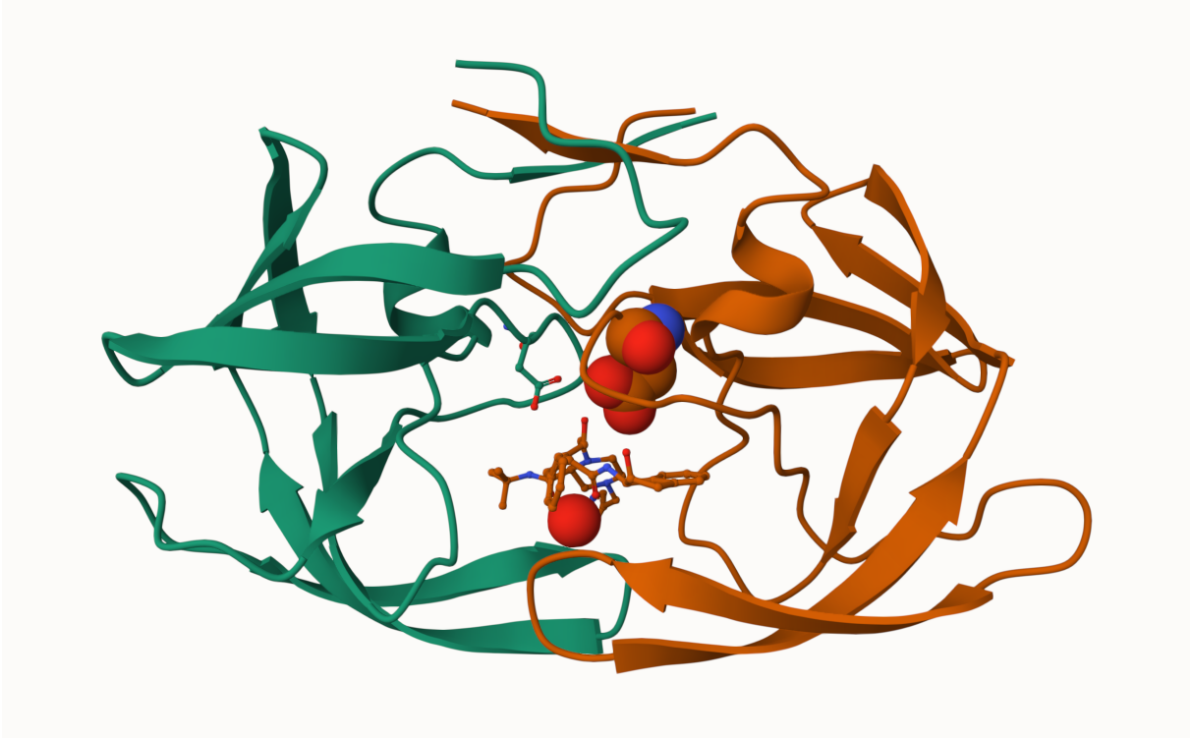
In MolStar, we can't see hydrogens because they are smaller than the resolution.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

Yes, it is water number 308.

Q6:

Here is a lovely figure of HIP-Pr with the catalytic ASP residues, the MK1 compound and the all-important water 308. The Asp residues are in ball and stick representation.



Reading PDB file data in R

We will use the Bio3D package for structural bioinformatics.

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

   Total Models#: 1
     Total Atoms#: 1686,  XYZs#: 5058  Chains#: 2  (values: A B)

     Protein Atoms#: 1514  (residues/Calpha atoms#: 198)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 172  (residues: 128)
     Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

Q7: How many amino acid residues are there in this pdb object?

198

Q8: Name one of the two non-protein residues?

MK1, the Merck drug.

Q9: How many protein chains are in this structure?

2: A and B.

We are finishing part 1 today with a calculation...

Predicting functional motions of a single structure

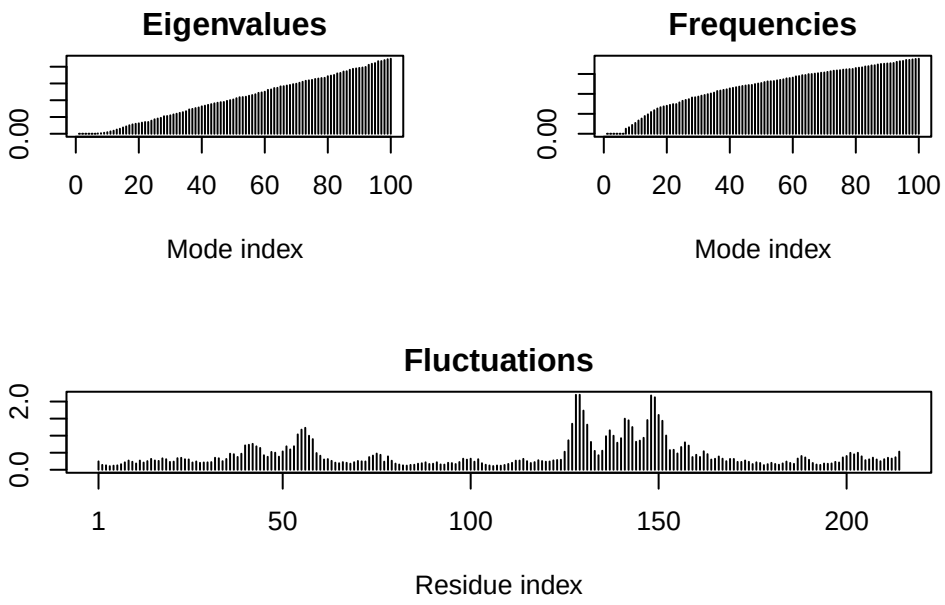
```
adk <- read.pdb("6s36")
```

```
Note: Accessing on-line PDB file
 PDB has ALT records, taking A only, rm.alt=TRUE
```

```
m <- nma(adk)
```

```
Building Hessian...        Done in 0.014 seconds.
Diagonalizing Hessian...   Done in 0.283 seconds.
```

```
plot(m)
```



```
mktrj(m, file="adk_m7.pdb")
```
