Q2. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```
# Filter count data where you have 0 read count across all samples.
newrows <- rowSums(countData) > 0

Running DESeq2

Nice, now lets setup the DESeqDataSet object required for the DESeq() function and then run the DESeq pipeline.

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
dds = DESeq(dds)

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship
```

```
fitting model and testing

dds

class: DESeqDataSet

Now we are getting our results for the two genes we want:

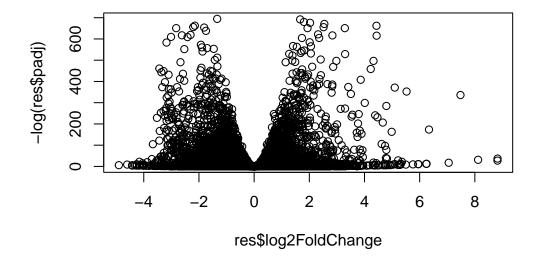

res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
```

Q3. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1

LFC < 0 (down) : 4396, 28%

low counts [2] : 1237, 7.7%
(mean count < 0)

[2] see 'independentFiltering' argument of ?results</pre>
```

Volcano Plot

```
plot( res$log2FoldChange, -log(res$padj) )
```

Q4. Improve this plot by completing the below code, which adds color and axis labels

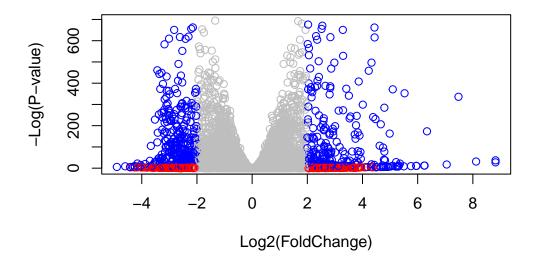

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- abs(res$padj) < 0.01 & abs(res$log2FoldChange) > 2

mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(</pre>
```

Adding gene annotation

Q5. Use the mapIds() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```

```

Q6. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file = "deseq_results.csv")
```

Section 2. Pathway Analysis

Here we are going to use the gage package for pathway analysis. Once we have a list of enriched pathways, we're going to use the pathview package to draw pathway diagrams, shading the molecules in the pathway by their degree of up/down-regulation.

```
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG

Q9. What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Most significant "Entities p-value": Cell cycle (mitotic), Cell cycle, Mitotic spindle checkpoint, Mitotic prometaphase, and Amplification of signal from the kinetochores. No, they do not match my KEGG results.

Maybe this is because before in KEGG I was sorting by which genes are the most up- or down-regulated, and we aren't looking at that in Reactome. Basically Reactome and KEGG are giving us different presentations of the data because they use different methods to acquire it.
